Presented at the Imperial College Optical Society (ICOS) and the IC student chapters of OSA and SPIE, July 28, 2020.

# How Light Behaves when the Refractive Index Vanishes

---

- Physics of Near-Zero Index (NZI) and Epsilon-Near Zero (ENZ) Materials
- Nonlinear Optical Properties of NZI and ENZ Materials
- Metamaterials for NZI and ENZ Studies
- Applications of NZI and ENZ Materials

# Giant Nonlinear Response of ENZ Metastructures

---

- Nonlinear Optics is important for a variety of reasons:

## Photonic Devices

All-optical switching, buffers and routers based on slow light

Used to create quantum states of light for

Quantum Computing/Communications/Imaging

Fundamental understanding of light-matter interactions

Not “just” Lorentz oscillator formalism

Understand rogue waves

Control filamentation process

- However, the nonlinear response is usually much weaker than the linear response
- Means to enhance the nonlinear response
  - Resonance interactions (atomic vapors)
  - Plasmonic systems
  - Electromagnetically induced transparency (EIT)
  - Metamaterials (composite materials)
- Our approach: Use epsilon-near-zero (ENZ) materials and metamaterials

# Physics of Near-Zero-Index (NZI) and Epsilon-Near-Zero (ENZ) Materials

---

- The wavelength of light is given by

$$\lambda = \lambda_{\text{vac}}/n$$

and is significantly lengthened in a NZI material. The wavelength approaches infinity as  $n$  approaches zero.

- The phase velocity of light is given by

$$v = c/n$$

and also approaches infinity as  $n$  approaches zero.

- For  $n$  approaching zero, the field oscillates in time but not in space; oscillations are in phase everywhere

Brown, Proc. IEE 100, 5 (1953).

Ziolkowski, Phys. Rev. E 70, 046608 (2004).

Silveirinha and Engheta, Phys. Rev. Lett. 97, 157403 (2006).

# Some Details from Electromagnetic Theory

---

- The linear response of any material to electromagnetic radiation can be described by

- The dielectric permittivity (dielectric constant)  $\epsilon$  define through the relation

$$\mathbf{D} = \epsilon_0 \epsilon \mathbf{E}$$

where  $\mathbf{D}$ , known as the dielectric displacement, and  $\mathbf{E}$ , known as the electric field, are the two fields that describe the material response to an electric field.

- The magnetic permeability  $\mu$  define through the relation

$$\mathbf{B} = \mu_0 \mu \mathbf{H}$$

where  $\mathbf{B}$ , known as the magnetic field, and  $\mathbf{H}$ , known as the magnetic intensity, are the two fields that describe the magnet response of a material to an applied field.

- It is straightforward to shown from the equations of electromagnetism that

$$n = \sqrt{\epsilon \mu}$$

- Thus,  $n=0$  when either  $\epsilon = 0$  or  $\mu = 0$  (or both  $\epsilon$  and  $\mu$  equal zero).

- Terminology:

ENZ: epsilon near zero

MNZ: mu near zero

EMNZ: epsilon and mu near zero

# Surface Reflection

- There is a problem getting light into a zero-index material.
- There is always reflection from the boundary between two materials
- The impedance and surface reflectivity are given by

$$Z = \sqrt{\mu/\epsilon} \qquad R = \left| \frac{Z - 1}{Z + 1} \right|^2$$

- Thus the reflectivity will be 100% if  $\epsilon = 0$  unless  $\mu = 0$  as well.

- This is one reason for the interest in developing EMNZ materials (epsilon and mu near zero materials).

# Physics of Epsilon-Near-Zero (ENZ) Materials

---

- Radiative processes are modified in ENZ materials

Einstein  $A$  coefficient (spontaneous emission lifetime =  $1/A$ )

$$A = n A_{\text{vac}}$$

We can control (inhibit!) spontaneous emission!

Einstein  $B$  coefficient

Stimulated emission rate =  $B$  times EM field energy density

$$B = B_{\text{vac}} / (n n_g)$$

Optical gain is very large!

Einstein, Physikalische Zeitschrift 18, 121 (1917).

Milonni, Journal of Modern Optics 42, 1991 (1995).

Equations are shown for nonmagnetic ( $\mu = 1$ ) materials

- Implications:
  - If we can inhibit spontaneous emission, we can build thresholdless lasers.
  - Expect superradiance effects to be pronounced in ENZ materials.

# Optics of Zero-Index Materials

- Snell's law leads to intriguing predictions

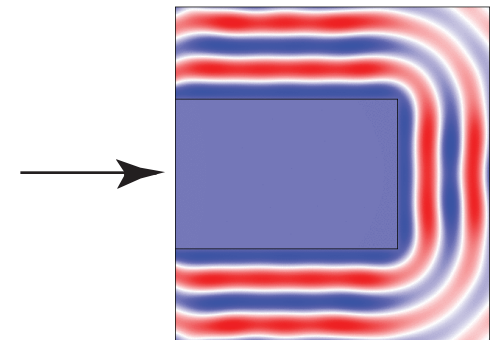

$$n_1 \sin \theta_1 = n_2 \sin \theta_2$$

- Light always leaves perpendicular to surface of ENZ material!

Y. Li, et al., Nat. Photonics 9, 738, 2015; D. I. Vulis, et al., Opt. Express 25, 12381, 2017.

- Thus light can enter an ENZ material only at normal incidence!

Light enters at normal incidence  
but leaves in all directions.

Y. Li, et al., Nat. Photonics 9, 738, 2015.

# Some Consequences of ENZ Behavior - 1

---

- “Funny” lenses

A. Alù et al., Phys. Rev. B 75, 155410, 2007; X.-T. He, ACS Photonics, 3, 2262, 2016.

- Large-area single-transverse-mode surface-emitting lasers

J. Bravo-Abad et al., Proc. Natl. Acad. Sci. USA 109, 976, 2012.

- No Fabry-Perot interference

O. Reshef et al., ACS Photonics 4, 2385, 2017.

# Some Consequences of ENZ Behavior - 2

- Super-coupling (of waveguides)

M. G. Silveirinha and N. Engheta, Phys. Rev. B 76, 245109, 2007; B. Edwards et al., Phys. Rev. Lett. 100, 033903, 2008.

- Coupling between two distant waveguides

Mode of upper waveguide beams into the lower waveguide even for large separation

Recall that  $k = n \omega / c$  vanishes in an ENZ medium.

- Automatic phase matching of NLO processes

- Recall that we need  $\Delta k = 0$ , but when  $n=0$   $k = n\omega/c$  vanishes and so does  $\Delta k$ .

- We have observed this effect in a Dirac-cone, zero-index metamaterial.

- Usual four-wave mixing process

- With zero-index materials we can have

# How Light Behaves when the Refractive Index Vanishes

---

- Physics of Near-Zero Index (NZI) Materials
- Nonlinear Optical Properties of NZI Materials
- Meta-materials for NZI Studies
- Applications of NZI Materials

# Nonlinear Optics and Optical Switching

---

- An important application in photonic technologies is optical switching.

- One wants a switch with fast switching times and that operates with weak control fields.
- One needs a nonlinear interaction in order for one optical field to control another field.
- A strong nonlinear response is needed. How does one quantify the strength of a nonlinear response? Two standard methods:

$$n = n_0 + n_2 I$$

$$P^{\text{NL}} = 3\chi^{(3)} |E|^2 E$$

- The nonlinear coefficients are  $n_2$  and  $\chi^{(3)}$

# Implications of ENZ Behavior for Nonlinear Optics

Here is the intuition for why the ENZ condition is of interest in NLO

Recall the standard relation between  $n_2$  and  $\chi^{(3)}$

$$n_2 = \frac{3\chi^{(3)}}{4\epsilon_0 c n_0 \operatorname{Re}(n_0)}$$

Note that under ENZ conditions the denominator becomes very small, leading to a very large value of  $n_2$

---

Footnote:

Standard notation for perturbative NLO

$$\mathbf{P} = \chi^{(1)}\mathbf{E} + \chi^{(2)}\mathbf{E}^2 + \chi^{(3)}\mathbf{E}^3 + \dots$$

$\mathbf{P}$  is the induced dipole moment per unit volume and  $\mathbf{E}$  is the field amplitude.

Also, the refractive index changes according to

$$n = n_0 + n_2 I + n_4 I^2 + \dots$$

# How to Choose an Epsilon-Near-Zero Materials

---

- Electrical conductors

All conductors display ENZ behavior at their (reduced) plasma frequency

Recall the Drude formula

$$\epsilon(\omega) = \epsilon_{\infty} - \frac{\omega_p^2}{\omega(\omega + i\gamma)}$$

Note that  $\text{Re } \epsilon = 0$  for  $\omega = \omega_p / \sqrt{\epsilon_{\infty}} \equiv \omega_0$ .

ENZ wavelength restricted to a limited range in the visible.

- Electrical insulators (dielectrics)

Dielectrics can show ENZ behavior at their (optical) phonon resonance.

ENZ wavelength restricted to a limited range in the mid-IR.

- Metamaterials

Can design the material so that the ENZ or EMNZ wavelengths are at any desired value.

- Challenge (for any material system). For low loss, we want  $\text{Im } \epsilon$  as small as possible at the wavelength where  $\text{Re } \epsilon = 0$ .

# Nonlinear Optics of Indium Tin Oxide (ITO)

---

- We recently reported that, at its ENZ wavelength, ITO possesses a nonlinear coefficient  $n_2$  that is 100 times larger than those of previously reported materials [1].
- ITO is a degenerate semiconductor (so highly doped as to be metal-like).
- ITO has a large density of free electrons, and a bulk plasma frequency corresponding to a wavelength of approximately 1.24  $\mu\text{m}$ .
- Dielectric properties of ITO are well described by the Drude formula.

$$\epsilon(\omega) = \epsilon_{\infty} - \frac{\omega_p^2}{\omega(\omega + i\gamma)}$$

- Note that aluminum-doped zinc oxide (AZO), another transparent conducting oxide, also has strong nonlinear response at its ENZ wavelength [2].

1. Alam, De Leon and Boyd, Science 352, 795–797 (2016)

2. Caspani, Shalaev, Boltasseva, Faccio et al., Phys. Rev. Lett. 116, 233901 (2016).

# Huge, Fast NLO Response of Indium Tin Oxide at its ENZ Wavelength

- ellipsometry

- $n_2$  can be  $3.4 \times 10^5$  times larger than that of silica glass

- overall change in refractive index of 0.8

- sub picosecond reponse time

# The NLO Response Is Larger For Oblique Incidence

Standard boundary conditions show that:

$$E_{\text{in},\parallel} = E_{\text{out},\parallel} = E_{\text{out}} \cos \theta$$

$$D_{\text{in},\perp} = D_{\text{out},\perp} \Rightarrow E_{\text{in},\perp} = E_{\text{out},\perp} / \epsilon = E_{\text{out}} \cos \theta / \epsilon$$

Thus the total field inside of the medium is given by

$$E_{\text{in}} = E_{\text{out}} \sqrt{\cos^2 \theta + \frac{\sin^2 \theta}{\epsilon}}$$

Note that, for  $\epsilon < 1$ ,  $E_{\text{in}}$  exceeds  $E_{\text{out}}$  for  $\theta \neq 0$ .

Note also that, for  $\epsilon < 1$ ,  $E_{\text{in}}$  increases as  $\theta$  increases.

# Huge Nonlinear Optical Response of ITO

- Z-scan measurements for various angles of incidence

Wavelength dependence of  $n_2$

Variation with incidence angle

- Note that  $n_2$  is positive (self focusing) and  $\beta$  is negative (saturable absorption).
- Both  $n_2$  and nonlinear absorption increase with angle of incidence
- $n_2$  shows a maximum value of  $0.11 \text{ cm}^2/\text{GW} = 1.1 \times 10^{-10} \text{ cm}^2/\text{W}$  at 1.25  $\mu\text{m}$  and 60 deg. This value is 2000 times larger than that away from ENZ region.

# Why is $n_2$ so large for ITO?

---

The short-wavelength (away from the ENZ resonance) value of  $n_2$  of ITO is  $5 \times 10^{-5} \text{ cm}^2/\text{GW}$ , which is 150 times larger than that of fused silica ( $3.2 \times 10^{-7} \text{ cm}^2/\text{GW}$ ).

There is a 43 x enhancement from working at the ENZ wavelength and an additional 43 x enhancement from using non-normal incidence.

Thus  $n_2 = 0.01 \text{ cm}^2/\text{GW}$ , which is  $3.4 \times 10^5$  times that of fused silica.

---

Incidentally, for arsenic trisulfide glass,  $n_2 = 2.4 \times 10^{-4} \text{ cm}^2/\text{GW}$ , which is 800 times larger than that of fused silica.

R.E. Slusher et al., J. Opt. Soc. Am. B 21, 1146 (2004).

# Why Does ENZ Lead to Large NLO Response?

1. From form of  $n_2$  
$$n_2 = \frac{3\chi^{(3)}}{4\epsilon_0 c n_0 \operatorname{Re}(n_0)}$$

2. From simple math:  $n = n_b + \Delta n$  and  $\epsilon = \epsilon_b + \Delta\epsilon$

Thus: 
$$\Delta n = \frac{\Delta\epsilon}{2n_b}$$

3. Note behavior of wave equation for  $\epsilon = 0$

$$\nabla \times \nabla \times \mathbf{E} + \frac{\epsilon\mu}{c^2} \frac{\partial^2}{\partial t^2} \mathbf{E} = -\mu \frac{\partial^2 \mathbf{P}^{\text{NL}}}{\partial t^2}$$

4. From Maxwell's equations, it is easy to show that the nonlinear response scales as

$$\left. \frac{dH_x}{dz'} \right|_{\text{nl}} \propto \sqrt{\frac{\mu_r}{\epsilon_r}} \frac{1}{|H_x|}$$

5. Detailed numerical integration confirms this behavior.

# Dependence of Second-Harmonic Generation on the Linear Dielectric Permittivity

- We solve the standard equations for second-harmonic generation

$$\frac{dA_1}{dz} = i \frac{\eta_1 \omega_1 \chi^{(2)}}{c} A_2(z) A_1^*(z) e^{-i\Delta k z},$$

$$\frac{dA_2}{dz} = i \frac{\eta_2 \omega_2 \chi^{(2)}}{2c} A_1^2(z) e^{i\Delta k z},$$

- We take  $\Delta k = 0$  and plot the solution for various values of the permittivity  $\epsilon$ .
- We find that the growth rate increases dramatically as the permittivity is decreased.

# An ENZ Metasurface

- We functionalize ITO by creating a photonic metasurface
- We obtain an even larger NLO response by placing a gold antenna array on top of ITO.
  - Lightning rod effect: antennas concentrate the field within the ITO
  - Coupled resonators: ENZ resonance and nano-antennas

Concept:

SEM:

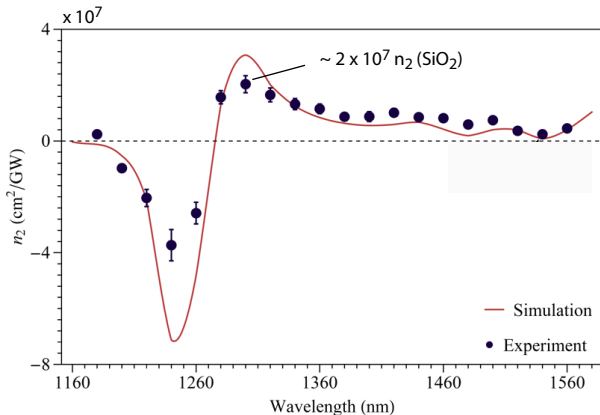

# A thin ENZ medium supports a bulk plasma mode.

A thin layer of ITO supports two modes

- the bulk plasma mode, also called the ENZ or long-range SPP mode
- the short range surface plasmon polariton (SPP) mode

# NLO response of the coupled antenna-ENZ system

The structure exhibits an extremely large  $n_2$  value over a broad spectral range. The on-resonance  $n_2$  value is **seven orders of magnitude** larger than that of silica glass.

# Giant Nonlinear Response of ENZ Metastructures: Our Team

---

## **Nader Engheta**

- H. Nedwill Ramsey Professor at the University of Pennsylvania
- B.S. degree from the University of Tehran and his M.S and Ph.D. from Caltech.
- Activities include ENZ, photonics, metamaterials, nano-optics, graphene optics, electrodynamics, microwave and optical antennas, studies of fields and waves.
- Many awards including the Streifer Award of IEEE and the Gold Medal from SPIE

## **Eric Mazur**

- Balkanski Professor of Physics and Applied Physics at Harvard University
- Ph.D. University of Leiden.
- Activities include light-matter interactions with ultrashort laser pulses, nonlinear optics at the nanoscale, and zero-index dielectric metamaterials.
- Awards include the Beller Award of OSA and the Millikan Medal of the AAPT

## **Alan Willner**

- Steven & Kathryn Sample Chair in Engineering at the University of Southern California.
- Ph.D. Columbia University
- Honors include Member of US National Academy of Engineering; Int'l Fellow of UK Royal Academy of Engineering; President of OSA and of IEEE Photonics Society.
- Activities include using nonlinearity for signal processing and wave manipulation.

# Three Metamaterial Platforms Under Investigation

- Nanoantennas coupled to ENZ substrate  
(out of plane; free-space coupling)  
(Rochester)
- Dirac cone metamaterials  
(in plane; compatible with integrated optics)  
(Harvard)
- Photonicallly doped metamaterials  
(out of plane; free-space coupling)  
(Penn)

# Dirac Cone Metamaterials

An EMNZ (epsilon and mu near zero) metamaterial

Opt Express 25, 8326 (2017)

It is also a ZIM  
(zero index material)

$$n = \sqrt{\epsilon\mu}$$

$$Z = \sqrt{\mu/\epsilon}$$

$$R = \frac{1 - Z}{1 + Z}$$

# Low-Loss Zero-Index Metamaterials via a Bound State in the Continuum -- Mazur Group

## TRADITIONAL ZIM DESIGN

- ✓ ZERO REFRACTIVE INDEX
- ✗ LOW QUALITY FACTOR:  $\sim 1000$
- ✗ POOR MODE CONFINEMENT
- ✗ LOW PROPAGATION LENGTH

## FABRY-PÉROT ZIM

- ✓ ZERO REFRACTIVE INDEX
- ✓ QUALITY FACTOR:  $5.1 \times 10^3$
- ✓ EASY TO FABRICATE

## SYMMETRY-PROTECTED ZIM

- ✓ ZERO REFRACTIVE INDEX
- ✓ QUALITY FACTOR:  $1.6 \times 10^4$
- ✓ 10X PROPAGATION LENGTH

# Photonic Doping of ENZ

$$\epsilon_{\text{eff}} \simeq 0$$

$$\mu_{\text{eff}} = \frac{1}{A} \left[ A_h + \frac{2\pi r_p}{k_p} \frac{J_1(k_p r_p)}{J_0(k_p r_p)} \right]$$

# Nonlinear Optical Properties of a Layered Metamaterial in its ENZ Region

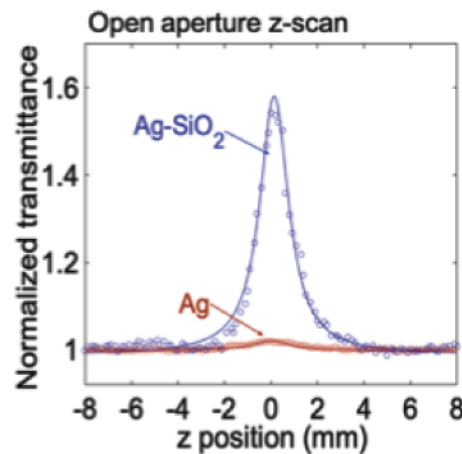

Do layered metamaterials also show enhanced NLO response at ENZ wavelength?

- By controlling the metallic fill fraction  $\rho$ , we can set the ENZ wavelength to be anywhere from 300 to 700 nm. We use  $\rho = 0.2$ , which corresponds to 500 nm. We deposit five layer pairs

- We perform Z-scan measurements on the sample. Note the enhanced response of the composite as compared to a single layer of silver.

- Note the pronounced peak in the value of  $n_2$  around the ENZ wavelength. We find a good but not perfect agreement with a simple effective medium theory.

# Physics and Applications of Epsilon-Near-Zero Materials

# Adiabatic Wavelength Conversion through Time Refraction

- Space refraction (e.g., Snell's law)

$$\frac{c}{f} = n \cdot \lambda \longrightarrow n_1 \lambda_1 = n_2 \lambda_2$$

- Time refraction (analog of Snell's law)

$$\frac{c}{f} = n \cdot \lambda \longrightarrow n_1 f_1 = n_2 f_2$$

Photon frequency (energy) is changed because of the temporal change in index, but the wavelength (inverse of momentum) is conserved in the absence of any spatial asymmetry

- Time refraction is an alternative way of understanding frequency broadening and shifting by self-phase modulation:

$$\delta\omega(t) = \frac{d}{dt}\phi_{\text{NL}} = \frac{d}{dt}[n_2 I(t)\omega/c]$$

# Laboratory Study of Wavelength Conversion by Time Refraction

- Pump beam creates a time-varying refractive index in ITO sample
- Frequency of probe beam is thereby modified.

OPA = optical parametric amplifier

wavelength = 1240 nm

pulse duration = 120 fs

OSA = optical spectrum analyzer

# Results: Adiabatic Wavelength Conversion by Time Refraction

Experimental results at 1240 nm

Probe phase and amplitude are measured by frequency-resolved optical gating (FROG)

The wavelength shift can be controlled by the pump intensity and the sign of the time delay.

- The observed effect is 100 times larger with almost 100 times smaller propagation distance than previous reports of AWC.
- Application: wavelength-division multiplexing for telecom

# Relaxed Phase-Matching Requirements in ENZ Media

- We study four-wave mixing in a zero-index waveguide

$$2\omega_p = \omega_s + \omega_i$$

- We find that an idler field is generated in both the forward and backward directions!
- Recall that we need  $\Delta k = 0$ , but when  $n = 0$ ,  $k = n \omega / c$  vanishes for each of the interacting waves and thus so does  $\Delta k$ .

- Significance: Nonlinear optical processes that were previously believed to be too weak to be useful can be excited through use of ENZ materials.

# Some Potential Applications of ENZ Behavior

## (a) Non-magnetic isolation

## (b) Full-band shifting and conjugation

## (c) High-speed tunable interferometers

## (d) On-demand quantum emitter

# Real-Time Holography with THz Refresh Rates

- Goal: Real-time holography with video or much faster refresh rates.
- The ultrafast response of ITO permits THz refresh rates
- Important applications involve image processing and signal processing
- Current real-time holographic materials cannot even support video frame rates

- Demonstration of image processing (edge enhancement)

# Special Thanks To My Students and Postdocs!

---

## Ottawa Group

## Rochester Group

# Summary: Physics and Applications of ENZ Materials

- Extremely interesting physical processes occur in ENZ materials
- ENZ materials, metamaterials, and metastructures display extremely large NLO response
- The huge, ultrafast NLO response of ENZ materials lend themselves to many important applications

The visuals of this talk are posted at [boydnlo.ca/presentations](http://boydnlo.ca/presentations)

# Dependence of Second-Harmonic Generation on the Linear Dielectric Permittivity

- We solve the standard equations for second-harmonic generation

$$\frac{dA_1}{dz} = i \frac{\eta_1 \omega_1 \chi^{(2)}}{c} A_2(z) A_1^*(z) e^{-i\Delta k z},$$

$$\frac{dA_2}{dz} = i \frac{\eta_2 \omega_2 \chi^{(2)}}{2c} A_1^2(z) e^{i\Delta k z},$$

- We take  $\Delta k = 0$  and plot the solution for various values of the permittivity  $\epsilon$ .
- We find that the growth rate increases dramatically as the permittivity is decreased.
